Signet 2540 High Performance Flow Sensor

3-2540.090

D 08/07 English

- SAFETY INSTRUCTIONS
- 1. Do not remove from pressurized lines.
- 2. Do not exceed maximum temperature/pressure specifications.
- 3. Wear safety goggles or faceshield during installation/service.
- 4. Do not alter product construction.
- 5. Apply sealant or PTFE tape to sensor threads, inspecting threads to ensure integrity. Do not install a sensor with damaged threads.

Pipe fittings **MUST** be installed by a certified welder only. Signet will not assume liability of any kind for improper fitting installations.

2540 Hot-Tap sensor specifications and limitations depend on the lowest maximum rating of the components associated with the system. For example, if a ball valve in the system is rated at a maximum 100 psi @ 175°F, you must limit the entire system's maximum pressure/temperature rating to 100 psi @ 175°F. All higher maximum specifications **MUST** yield to the component with the lowest maximum specification.

- 17 bar (250 psi) @ 82°C (180°F) with standard FPM sensor fitting O-rings.
- 17 bar (250 psi) @ 100°C (212°F) with optional EPDM sensor fitting O-rings.

Note: Pressure/temperature specifications refer to sensor performance in water. Certain chemical limitations may apply. Chemical compatibility should be verified.

2. Sensor Mounting Position

Vertical mounting is recommended for best overall performance. Mount at a maximum of 30° when air bubbles are present. **DO NOT** mount on the bottom of the pipe when sediments are present.

3. Sensor Wiring

Signet Instruments

• Use 2-conductor shielded cable for cable extensions up to 300m (1000 ft.)

Maintain cable shield through splice.

Other Brands

- pull-up resistor required (10 kΩ recommended).
- Use 2-conductor shielded cable for cable extensions up to 300m (1000 ft.)

Maintain cable shield through splice.

4. Electronics Module Installation and Removal

The electronics module of this sensor can be replaced without removing the steel sensor body from the line.

- 1. Loosen liquid tight connector cap.
- 2. Loosen liquid tight connector compression fitting from sensor body.
- 3. Grasp the electronics at the rubber strain relief (do not pull on cable) and pull firmly.

To reinstall the electronics module:

- Insert module into sensor housing, making sure module is fully seated. The tip of the electronic module must bottom-out in the sensor housing.
- Replace the liquid tight connector assembly. NOTE: Apply thread sealant to the liquid tight connector threads.

To install the cable inside protective conduit, remove the liquid tight connector completely. Thread ½ in. conduit into top of sensor body.

5. Installation

The following items are required to properly install Signet 2540 Sensors.

5.1 Hardware, Standard Sensor

- Female pipe fitting (weld-on or saddle) with 1½ in. NPT or ISO 7-Rc 1½ threads
- 32 mm (1¼ in.) diameter drill
- · Pipe thread sealant
- Tape measure

5.2 Hardware, Hot-Tap Sensor

The Hot-Tap sensor requires all the standard sensor items plus:

- Hot-Tap drilling machine (e.g., Mueller drilling machine or equivalent)
- Female ball or gate valve (full port only) with 11/2 in. NPT or ISO 7-Rc 11/2 threads
- Male pipe nipple, 32 x 50 mm (11/2 x 2 in.) with 11/2 in. NPT or ISO 7-R 11/2 threads
- Hot-Tap installation tool (purchased separately)

5.3 Standard Fitting Installation

- A. Depressurize and drain pipe.
- **B.** Wearing safety face protection, drill a 32 mm (1¼ in.) diameter hole in the pipe.
- C. Install the pipe fitting of the outside of the pipe according to the manufacturer's instructions. Failure to follow these instructions may result in serious bodily injury and/or product failure.
- D. Remove sensor fitting from sensor assembly.
- E. Thread sensor fitting into pipe fitting. (Fig. 1)

5.4 Hot-Tap Fitting Installation

- A. Install the pipe fitting on the outside diameter of the pipe according to the manufacturer's instructions. Failure to follow these instructions may result in serious bodily injury and/or product failure.
- **B.** Install the pipe nipple and isolation valve (ball or gate valve) onto the external pipe fitting using pipe sealant on the threads. (Fig. 2)

- C. Wearing safety face protection, install an appropriate hole cutting tool per manufacturer's instructions (e.g., Mueller drilling machine) with a 32 mm (1.25 in.) drill onto the top of the isolation valve, ensuring a tight fit. Use the recommended drill bit size or damage to the isolation valve may occur.
- **D.** Open the isolation valve and insert the drill through the valve and cut the sensor clearance hole. After the hole is cut, withdraw the drill from the isolation valve and close the valve. Remove the drilling machine per manufacturer's instructions. (Fig. 3)
- E. Install the sensor fitting/bleed valve into the top of the isolation valve. Make sure the bleed valve clears the handle of the isolation valve during operation.

Fig. 3

5.5 Calculating the H Dimension

Before installing the sensor some critical dimensions must be established (for Hot-Tap installations, we assume the pipe dimensions are known). The rotor shaft must be located 10% inside the pipe I.D. to ensure accurate calibration capability. To accomplish this, the "H" dimension is measured from the outside surface of the pipe to the bottom of the sensor flange.

Nominal "H" dimensions for standard pipes are listed here. For non-standard pipe dimensions, calculate the "H" dimension using the formula listed below. The wall thickness and inside diameter (I.D.) are required for the "H" dimension calculation.

The 6 inch ruler (included) may be used to measure your pipe I.D. and wall thickness up to 5 inches (standard sensors only).

H Dimensions, Standard Sensors (2540-1, 2540-2)

Wrought Steel Pipe Per ANSI 36.10

Stainless Steel Pipe Per ANSI B36.19

Standard Sensors: H = 5.23 - wall thickness - (0.10 x I.D.) Hot-Tap Sensors: H=15.39 in. - wall thickness - (0.10 x I.D.)

Example: 3.0 inch schedule 80 wrought steel Wall thickness = 0.3 in. / Inside diameter = 2.9 in.

H = 5.23 - 0.3 - (0.10 X 2.9) / H = 117.86 mm (4.64 in.)

Record your sensor's "H" dimension for future reference:

After correct dimensions are calculated and recorded, the sensor can be installed in the fitting. The Standard and Hot-Tap versions require substantially different procedures.

H=

5.6 Standard Sensor Installation

- A. Thread one hex nut onto each of the three threaded rods included in package. Install threaded rod with a lock washer onto the sensor fitting. Secure rods in place by tightening each hex nut against the sensor fitting. (Fig. 4)
- B. Thread one jam nut and lower hex nut onto each threaded rod so that the top surface of each nut is at the proper "H" dimension for your pipe. Secure each hex nut with a jam nut. (Fig. 5)
- **C.** Insert the flow sensor into the sensor fitting, making sure the alignment hole on the sensor flange is pointing downstream.
- D. Place the alignment rod in the alignment hole on the sensor flange. Align the flange so rod is parallel to the process pipe. (Fig. 6)
- E. Thread upper hex nuts with lock washers until they contact the sensor flange and tighten. Check for proper "H" dimension and readjust if necessary. (Fig. 7)

5.7 Hot-Tap Sensor Installation

- A. Thread one hex nut onto each of the three threaded rods included in package. Install threaded rod with a lock washer onto the sensor fitting. Secure rods in place by tightening each hex nut against the sensor fitting. (Fig. 8)
- B. Thread one jam nut and lower hex nut onto each threaded rod so that the top surface of each nut is 359 mm (14.14 in.) from the top surface of the sensor fitting. Secure each hex nut with a jam nut. (Fig. 9)

CAUTION: This setting is critical to ensure an adequate sensor seal and to prevent the rotor from hitting the isolation valve orifice during installation.

- C. Wipe the sensor body with a dry, clean cloth. Orient the alignment hole on the sensor flange to point downstream. Place the slotted flange over the threaded rods. Lower the sensor into the fitting until the sensor flange rests on the lower hex and jam nuts.
- **D.** Secure the sensor with lock washers and upper hex nuts on the top of the flange. Before tightening, align the sensor flange so that the alignment rod is parallel and level with the process pipe. (Fig. 10 & Fig. 11)
- E. Make sure the bleed valve is closed (full clockwise position).

Fig. 10

The flow sensor alignment rod **MUST** be parallel to the process pipe as shown. **Fig. 6**

Fig. 7

Hot-Tap Sensor Installation - Continued

F. Thread protector plate hex nuts onto each of the three threaded rods. Adjust each hex nut to a height of approximately 25 mm (1 in.) from the top of each rod. (Fig. 12)

- G. Position the installation tool bearing plate by rotating it so that it is approximately 40 mm (1.6 in.) from the swivel mount. Mount the installation tool by placing the threaded rods through the holes in the tool's bearing plate, resting the bearing plate on top of the protector plate hex nuts. Make sure the swivel mount's ears are mounted **between** the threaded rods (not over the rods). Install the bearing plate cap nuts. Tighten the bearing plate cap nuts to secure the installation tool in place. (Fig. 13)
- **H.** Align the sensor cable with the swivel mount cable port to prevent cable pinching. Use a 3/8 inch wrench or socket to turn the installation tool shaft clockwise until it is seated in the hole at the top of the sensor flange.
- I. Wearing safety face protection, **slowly open the isolation valve to the full open position**. Loosen the lower hex and jam nuts and move them to the proper "H" dimension. Turn the installation tool shaft **clockwise** until the sensor flange contacts the lower hex and jam nuts. Thread the upper hex nuts down until they contact the sensor flange. Tighten the upper hex nuts to secure the sensor. (Fig. 14)
- J. Remove cap nuts and withdraw the installation tool. Be careful to not damage cable. Replace protector plate and cap nuts. (Fig. 15)

6. Standard Sensor Removal

To remove the sensor from a **depressurized empty pipe**, simply remove the cap nuts and upper hex nuts located above the sensor flange. Pull up on sensor flange with twisting motion.

7. Hot-Tap Sensor Removal

To remove the Hot-Tap sensor safely from a pressurized active pipe, the entire installation process must be reversed.

- A. Remove the cap nuts, protector plate and protector plate hex nuts. (Fig. 16)
- B. Thread installation tool in place and secure bearing plate in place of sensor protector plate. (Fig. 17)
- C. Turn shaft of installation tool clockwise to lower tool into opening in sensor flange. Guide cable into the port to prevent damage.

- D. Wearing safety face protection, loosen the upper hex nuts and raise to 372 mm (14.6 in.) from top of sensor fitting to bottom of upper hex nuts/lock washers. CAUTION! This measurement is critical to maintain watertight seal in sensor while allowing clearance to close the isolation valve.
- E. Wearing safety face protection, turn the installation tool shaft counterclockwise to withdraw sensor until the sensor flange contacts the upper hex nuts. (Fig. 18)
- F. Raise one lower hex and jam nut to bottom of sensor flange.
- G. Close isolation valve, remove bearing plate and tool.
- H. Wearing safety face protection, cover the bleed valve with suitable protection (rag, towel, etc.) and open the bleed valve (ccw rotation) to relieve internal pressure. Pull sensor up until bleed valve purges some fluid (indicating sensor is past 1st o-ring seal inside sensor fitting).

CAUTION: In case of a leaky isolation valve, the sensor will be under a slight amount of pressure. Care should be taken when removing the sensor. Use the bleed valve to relieve this pressure taking care not to spray fluid on yourself or others.

Sensor can now be safely removed. When reinstalling the sensor: leave one lower hex nut in position to guide sensor to proper isolation valve clearance height before opening isolation valve. Return to "H" dimension height after valve is opened.

8. Maintenance

Your sensor requires little or no maintenance of any kind, with the exception of an occasional sensor/paddlewheel cleaning.

Rotor Replacement Procedure

- 1. With a small pair of needle-nose pliers, firmly grip the center of the rotor pin (axle) and with a twisting motion, bend the rotor pin into an "S" shape. This should pull the ends of the pin out of the retainers and free the rotor assembly.
- Remove retainer from each side by gently tapping it inwards using a punch. Install a new retainer with its rotor pin clearance hole inward. Only install one retainer at this time.

- 3. Insert the new rotor assembly and bearings into the rotor housing of the sensor and place the new rotor pin (axle) through the open end of the rotor housing, through the rotor and bearings, and into the previously installed retainer.
- 4. Tap the second retainer (rotor pin clearance hole inwards) into the hole while lining up the rotor pin with the center of the retainer hole. This completes the rotor replacement procedure.

K-factors are listed in U.S. gallons and in liters. Conversion formulas for other engineering units are listed below.

• K = 60/A

The K-factor is the number of pulses generated by the 2540 paddlewheel per unit of liquid in a specific pipe size.

To convert		multiply

10. Specifications

General Data

Flow velocity range: Linearity: Repeatability: Pipe range:

Standard version:Hot-Tap version:Sensor fitting options:

Cable length:

Cable type:

Electrical Data

Supply voltage: Supply current: Output type: Output current:

Wetted Materials

Sensor body: Sensor fitting: Sensor fitting O-rings: Rotor: Rotor shaft:

Shaft retainers (2): Rotor bearings (2): 0.1 to 6 m/s (0.3 to 20 ft/s) ±1% of full range ±0.5% of full range

38 to 610 mm (1.5 to 24 in.) 38 to 914 mm (1.5 to 36 in.) 316 SS with 1.5 in. NPT threads, **OR** 316 SS with IS0 7-R 1½ threads 7.6 m (25 ft.), can splice up to 300 m (1000 ft.) 2-conductor twisted-pair with shield

5 to 24 VDC 1.5 mA max. Open collector, sinking 10.0 mA max.

316 stainless steel 316 stainless steel Standard FPM, optional EPDM CB7 Cu-1 alloy 17-4 per AMS5355H Tungsten carbide (standard) 316 stainless steel (option) 316 stainless steel Fluoroloy B®

Fluid Conditions

Maximum operating pressure/temperature:

- Sensor with standard FPM sensor fitting O-rings:
- 17 bar (250 psi) @ 82°C (180°F)
- Sensor with optional EPDM sensor fitting O-rings: 17 bar (250 psi) @ 100°C (212°F)

Note: Pressure/temperature specifications refer to sensor performance in water. Certain chemical limitations may apply. Chemical compatibility should be verified.

Caution: The 2540 Hot-Tap system's overall specifications and limitations depend on the lowest maximum rating of the components associated with the system. In other words, the Hot-Tap system is only as strong as its weakest link. For example, a ball valve, a

component of the system, is rated at a maximum 100 psi @ 175°F, limiting the entire system's maximum pressure/temperature rating to 100 psi @ 175°F. All higher maximum specifications **MUST** yield to the component with the lowest maximum specification.

Standard Sensor Dimensions: • $2540-1(S) = 1\frac{1}{2}$ in. NPT fitting • $2540-2(S) = IS0 7-R 1\frac{1}{2}$ fitting

• 2540-4(S) = IS0 7-R 1½ fitting

Notes:

11. Ordering Information

Sensor Pa	art N	lumbe	r				
3-2540	Sta	ainles	s Steel High Performance flow sensor with removable electronics				
	Mc	ounting	g option - choose one				
	-1	1½ i	nch NPT thread				
	-2	1½ inch ISO thread					
	-3	11/2 inch NPT thread, hot tap design*					
	-4	1½ i	1½ inch ISO thread, hot tap design*				
	1	Rotor Pin Material					
		- Tungsten Carbide					
		-S	Stainless Steel
